

• VC DEALFLOW SCREENING

The inbox never empties. Don't let a skim cost you the unicorn.

EvalLens gives every inbound deck the same structured first read, on one consistent bar, so the one that matters never gets waved through on a skim. Screen a full batch in an afternoon — the final call is always yours.

1 bar — no drift between decks	100% of inbound gets a real read, not a skim	4–5 min machine first-read per deck	1000+ runs the scoring logic has been tuned on
--	--	---	--

• WHY MANUAL SCREENING BREAKS

Too much dealflow. Too little time to read it.

VOLUME**Inbound never stops**

More decks land each week than any partner can read line by line — and the queue never resets.

PARTNER TIME**Partner time is the bottleneck**

The first few decks in the queue get a real read. The rest get a skim — and the breakout could be sitting further down the pile.

THE BAR**The bar drifts**

One analyst leans on traction, another on team fit — run the same deck through twice and you can get two different calls.

DEFENSIBILITY**Hard to defend the call**

Ask why a deck died six months ago, and the honest answer is a shrug — not something you can bring to your IC or your LPs.

• THE WHOLE LOOP, END TO END

How a single screening runs

- 01 Collect the dealflow**
Founders submit decks and you drop in inbound — everything lands in one place.
- 02 Set your thesis bar**
Choose the scale, weights, and dimensions that match your fund's thesis.
- 03 Run the machine pass**
EvalLens prepares a structured first read of every deck — about 4–5 minutes per deck after upload.
- 04 See the ranked reports**
The whole batch lands in one leaderboard, each deck with its one-page screening memo — thesis, risks, gaps — ready before anyone opens a call.
- 05 Score it with your own judgment**
Weigh what EvalLens surfaced against your own read of the deck, and set the score that counts. The call stays human, every time.

• WHAT YOU GET

What the fund gets

• A memo for every deck

Thesis, risks, and a recommendation to dig or pass — the same shape for every deck in the batch.

• Questions for the IC

What to verify before the partner meeting, already surfaced.

• One screening bar

Every deck runs through the same logic — you can compare them side by side.

• A ranked shortlist

The whole batch on one bar, from strongest to weakest — the field at a glance.

• Risks and missing data

Where the deck has gaps, and what to ask the founder.

• Evidence you can point to

Every score traces to a line in the deck — defensible to your IC and your LPs.

• AI PREPARES, THE PARTNERS DECIDE

Not a black box. Not a partner replacement.

EvalLens prepares the analysis; it never makes the final call. It widens what your team can read closely — so the breakout gets the same first read as every warm intro.

One bar for every deck

Every deck runs through the same scoring logic — the outlier gets the same first read as the warm intro.

Every score is cited

Scores trace to evidence in the deck — defensible to your IC and your LPs, not a gut call.

You set the final score

Control stays with the partners. The ranking runs on your call, not the AI's.

AI prepares the analysis. Humans decide.

• WHERE IT FITS

Built for how a fund screens

Inbound screening

Every inbound deck gets the same real first read — so the breakout in the pile doesn't get skimmed while the team is buried.

Thesis-fit filtering

Score decks against your fund's thesis, not a generic rubric. Weight the dimensions that decide your investments.

IC preparation

Every deck that clears the screen arrives with strengths, risks, and what to verify. The full IC memo stays yours.

Demo-day & batch review

Screen a whole cohort in one pass right after the pitches — every startup compared on equal footing.

Run a pilot on your real dealflow

We screen a real batch of your inbound, prepare partner-ready memos, and show how EvalLens ranks your dealflow — while the call stays yours.
